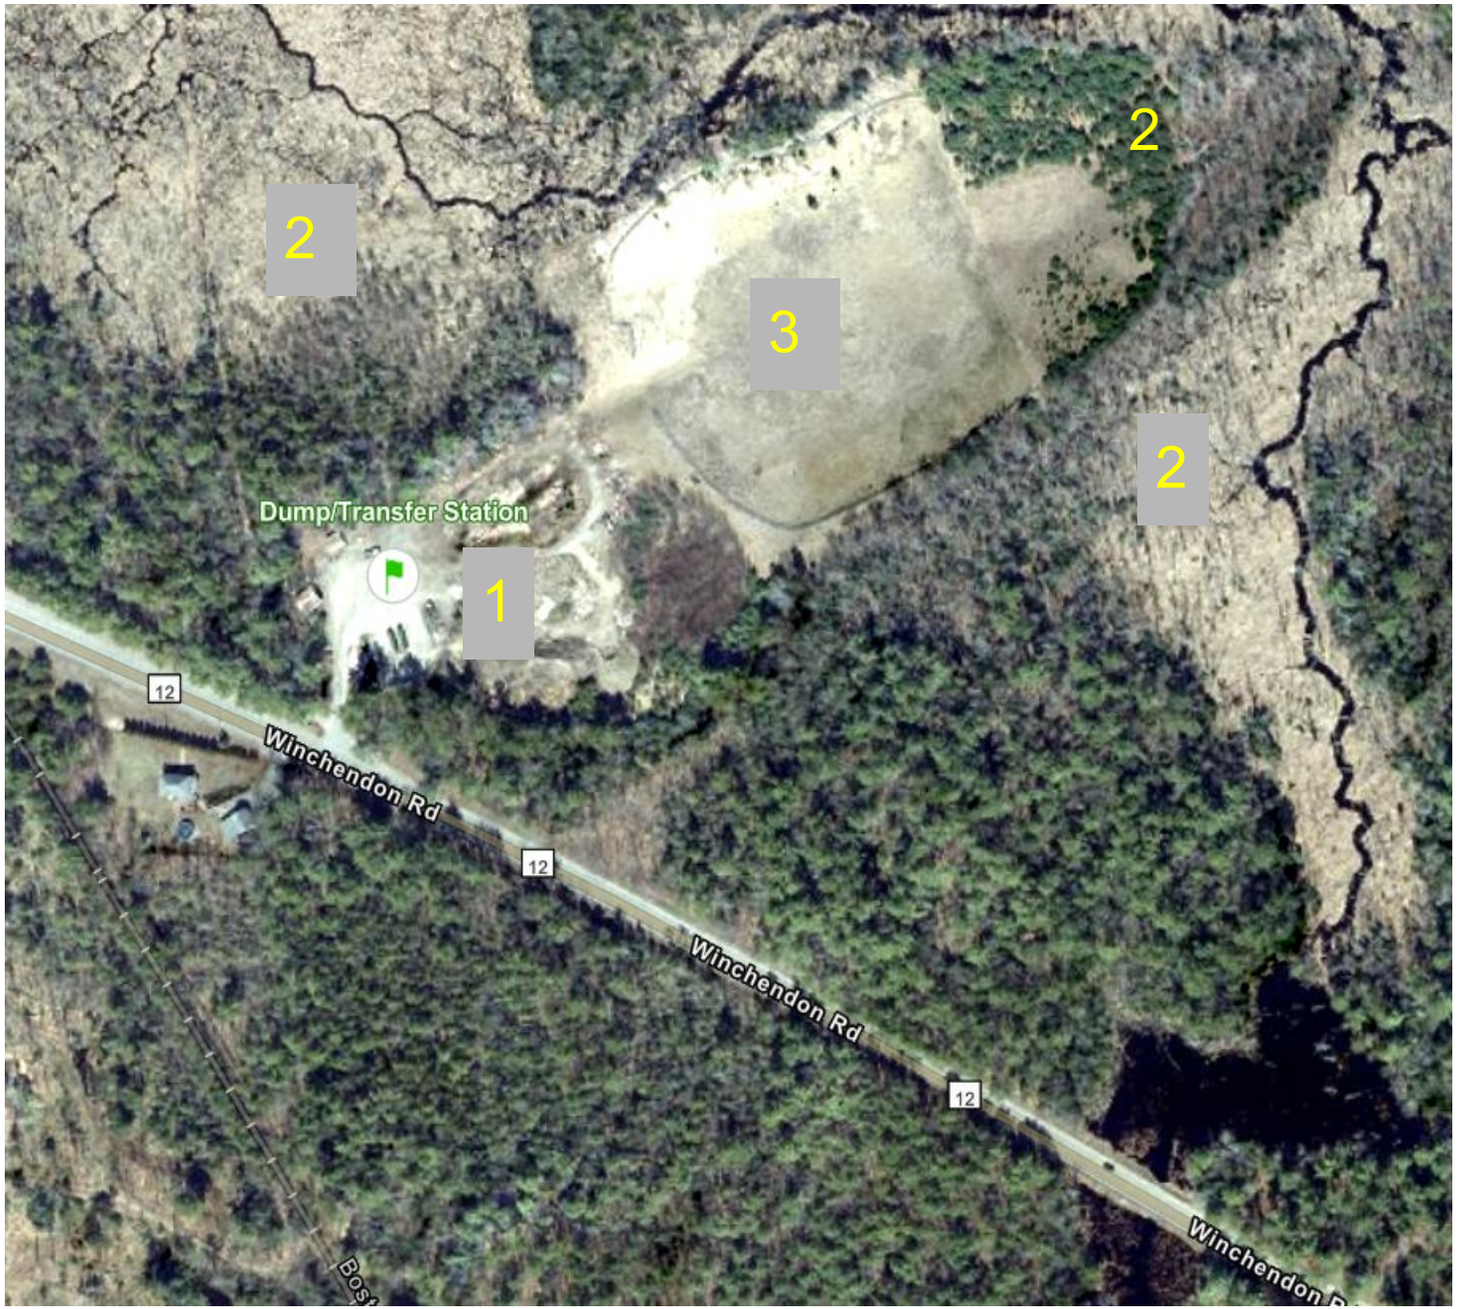
Site Study Ashburnham: Dump/Transfer Station



About this site: The dump/transfer station site (1) is situated on Winchendon Road/Rt. 12 at the far western border of the town, surrounded by wetlands (2). The entire back portion of the site is unused (3). The site was a town dump years ago, but has been capped. The town has discussed closing the transfer station due to the cost to run, but has currently opted to keep it open with a modified system for waste delivery.

Community concerns about Dump/Transfer Station

There are concerns that invasive species surrounding the perimeter of the old dump may threaten the nearby wetland complex.

Nature-based Solutions Recommended for Ashburnham: Dump/Transfer Station

F Flooding NbS

D Drought NbS

RT Rising temps NbS

DW Degraded water NbS

DL Degraded landscape NbS

B Loss of biodiversity NbS

NbS Narrative/NbS Project Templates for Ashburnham: Dump/Transfer Station

NbS Recommendations

- The dump site has the potential to be reused for ball fields, recreation areas, possible grassland habitat for birds, or solar field options.
- Waste Management trucks everything out from the site– except for brush, which gets burned. This transfer station might close, or it might regionalize (in which case, locals will have to send their trash to Winchendon). The City did renew the contract with Waste Management for one more year.
- There is potential for ecological restoration here if the contract with Waste Management does not get renewed again.

Soils Information for Ashburnham: Dump/Transfer Station

Ashburnham

Large amounts of high functioning soil and its position high in the watershed highlight the importance of protecting soil health in Ashburnham.

Ashburnham stands out among the five focus communities as having a particularly large acreage of high functioning soils that are storing over 2 million metric tons of soil organic carbon (SOC). The richest deposits of SOC are found in the wetland systems that extend from the town's major lakes. The 21,170 acres of "high function/high carbon" soils represent 80% of the town's land area and is about 3 times as much area of high functioning soil as the average in the other 4 towns. Ashburnham straddles two major watersheds with the lands to the southeast of town ultimately draining to the Nashua River, and this position highlights the town's importance in protecting and managing soil health to prevent unwanted downstream effects like flooding and poor water quality. Compared to the other four focus communities, the town has limited areas of degraded soils with potential for regeneration (just 5.7% of the land area is classified as having high regeneration potential because of the relatively little soil disturbance in Ashburnham).

Sites Considered for Nature-based Solutions

Despite having such large area of high functioning soil, several sites that see seasonal flooding have been identified in this project. The sites selected for potential Nature-based Solutions are largely nearby water bodies or streams in areas where soil function has been degraded. Efforts to increase soil capacity to store or slow stormwater flow in these locations may have a positive impact and be important demonstration sites. These site specific interventions should be complemented by efforts to conserve and protect important healthy soil resources throughout the town's forested uplands and the wetlands extending from the town's large water bodies.

Priority Actions for Protecting/Enhancing Soil Health in Ashburnham

Increased protection and climate forward management of wetlands and forests.

Example Nature-based Solutions:

- Land acquisition and conservation easements
- Forested upland protection district (see Deerfield example, appendix 1)
- Transfer of development from rural to infill locations, including across town borders (See Deerfield example, appendix 1)
- Forest tree planting to increase climate-adapted species abundance and total stock and to preserve forest structure
- Improving local bylaws for wetland protections

#	SITE	PREDOMINANT SOIL FUNCTIONS FOR RESILIENCE			
		Highly Degraded	High Regeneration Potential	Moderate-Low Function	High Function
1	Phillips Brook/Residential Area on Main St.	◆	◆		◆
2	Pump Station			◆	
3	Sweeney Park	◆	◆		
4	Dump/Transfer Station			◆

Nature-based Solutions Opportunity Table Ashburnham: Dump/Transfer Station

Value	BEST	BETTER	GOOD
Feasibility	high	mid	low
Ownership	Municipal		

Best Value = An improvement to a resource that provides significant lasting resiliency and strengthens or serves related resources

Better Value = Makes significant improvements to resiliency with long lasting effect

Good Value= Improves the habitat value, or resiliency of a site or feature

Feasibility is based on property ownership or technical access

NbS Template#	Nature-based Solution Description	Dump/Transfer Station
	Natural Environment Restructuring	
1	River / pond bank revegetation	
2	Grassland meadow management restoration	mid
4	Wetland management restoration	
5	New wetland or floodplain construction / expansion	
7	Stream flow alteration	
8	Pollinator hedgerow buffer

This "Building Community Climate Resilience: Nashua River Watershed-wide Nature-based Solutions Plan" is funded by a Municipal Vulnerability Preparedness grant awarded to the City of Fitchburg by the Healey-Driscoll Administration's Municipal Vulnerability Preparedness (MVP) program, which is administered by the Executive Office of Energy and Environmental Affairs (EEA). NRWA was the lead coordinator for this project.
