Site Study Ashburnham: Pump Station

About this site: This is the main sewage pump station in the town (1), and serves both the Oakmont Regional Schools and Cushing Academy. The Whitman River (2) lies just to the east of the site, and the Whitman Reservoir (3) just to the southeast. The Reservoir is not a part of Ashburnham's drinking water supply.

Community concerns about the Pump Station

During times of high rain and stormwater runoff, the town frequently has to hire trucks to transport the wastewater to the treatment plant due to flooding that incapacitates the pumps.

The town is investigating moving the pumping station controls out of their current underground position to reduce the incidence of the pumps shutting off.

Flooding is occurring during times of high rain and stormwater runoff, and residents are pumping water from their basement sumps into their sewage hookups – this adds to the town's burden.

This area remains one of the highest priorities due to the frequency and severity of flooding.

- D Drought NbS
- RT Rising temps NbS
- DW Degraded water NbS
- DL Degraded landscape NbS
- B Loss of biodiversity NbS

NbS Narrative/NbS Project Templates for Ashburnham: Pump Station

NbS Recommendations

- A bylaw could be adopted to mandate the discharge of sump pump water outside on the ground instead of into the sewage system.
- It would be desirable to have the schools and other large contributors investigate the possibility of installing on-site sewage disposal systems with leach fields, which would greatly reduce the burden and cost of the town's sewage system.
- In the new FEMA maps, this pump station is located in the floodplain area. This area tends to overflow into the Whitman River, and there is substantial groundwater beneath the tanks; it might be worthwhile to consider relocating the pump station.

Soils Information for Ashburnham: Pump Station

Ashburnham

Large amounts of high functioning soil and its position high in the watershed highlight the importance of protecting soil health in Ashburnham.

Ashburnham stands out among the five focus communities as having a particularly large acreage of high functioning soils that are storing over 2 million metric tons of soil organic carbon (SOC). The richest deposits of SOC are found in the wetland systems that extend from the town's major lakes. The 21,170 acres of "high function/high carbon" soils represent 80% of the town's land area and is about 3 times as much area of high functioning soil as the average in the other 4 towns. Ashburnham straddles two major watersheds with the lands to the southeast of town ultimately draining to the Nashua River, and this position highlights the town's importance in protecting and managing soil health to prevent unwanted downstream effects like flooding and poor water quality. Compared to the other four focus communities, the town has limited areas of degraded soils with potential for regeneration (just 5.7% of the land area is classified as having high regeneration potential because of the relatively little soil disturbance in Ashburnham).

Sites Considered for Nature-based Solutions

Despite having such large area of high functioning soil, several sites that see seasonal flooding have been identified in this project. The sites selected for potential Nature-based Solutions are largely nearby water bodies or streams in areas where soil function has been degraded. Efforts to increase soil capacity to store or slow stormwater flow in these locations may have a positive impact and be important demonstration sites. These site specific interventions should be complemented by efforts to conserve and protect important healthy soil resources throughout the town's forested uplands and the wetlands extending from the town's large water bodies.

Priority Actions for Protecting/Enhancing Soil Health in Ashburnham

Increased protection and climate forward management of wetlands and forests.

Example Nature-based Solutions:

- Land acquisition and conservation easements
- Forested upland protection district (see Deerfield example, appendix 1)
- Transfer of development from rural to infill locations, including across town borders (See Deerfield example, appendix 1)
- Forest tree planting to increase climate-adapted species abundance and total stock and to preserve forest structure
- Improving local bylaws for wetland protections

#	SITE	PREDOMINANT SOIL FUNCTIONS FOR RESILIENCE			
		Highly Degraded	High Regeneration Potential	Moderate-Low Function	High Function
1	Phillips Brook/Residential Area on Main St.	◆	◆		◆
2	Pump Station			◆	
3	Sweeney Park	◆	◆		
4	Dump/Transfer Station			◆

This "Building Community Climate Resilience: Nashua River Watershed-wide Nature-based Solutions Plan" is funded by a Municipal Vulnerability Preparedness grant awarded to the City of Fitchburg by the Healey-Driscoll Administration's Municipal Vulnerability Preparedness (MVP) program, which is administered by the Executive Office of Energy and Environmental Affairs (EEA). NRWA was the lead coordinator for this project.
